MUSICAL CHAIRS!

Our aim is to achieve a healthy mixture. Nowadays, if you speak of silviculture, you also have to include forest conversion and the energy revolution. In keeping with the site, close to nature, stable, efficient, renewable: adaptable forests convince in all aspects. With a view to species diversity, climate change, cost-effectiveness and sustainability.
Our aim is to achieve a healthy mixture of cost-effectiveness and sustainability. Nowadays, if you speak of silviculture, you also have to include forest conversion and the energy revolution. In keeping with the site, close to nature, stable, efficient, renewable, adaptable: forests that are also species-diverse, climate-change-proof. We don't plant any trees at all. The forest provides those for free. As long as there are a couple of old trees left, you only need to create the right conditions for the new generation to emerge. That saves a pile of money for planting, of course.

STEFAN BAUERNFEIND, FOREST DISTRICT LANDSBERG
FOR NATURE, WITH NATURE

Natural regeneration has better roots, a stronger footing in the ground and better growth. The next generation of trees develops from the seeds of the old trees. Desired tree species are specifically encouraged by silvicultural measures, the genetic resources of the forest are preserved.

"It is quite possible that our grandchildren will get a better forest than the one inherited by my generation."

ALOIS GLÜCK, POLITICIAN
No worries about demographics:

The oldest oaks in the Bavarian State Forests stand in the Spessart – and they are over half a millennium old. This young oak, on the other hand, only has three years under its belt.

"The prognosis for Bavaria is that the climate will be around two degrees warmer by the end of the century, and that is why we are now already looking at regions in southeast Europe: The tree species that grow there without any difficulty will also be suited to our latitude in future."

HUBERT DROSTE, HEAD OF THE FOREST DISTRICT ZUSMARSHAUSEN

NATURAL AND COST-SAVING

Nature is a dedicated helper when it comes to forest conversion. Natural regeneration brings the forest a new generation of trees that fits and saves hard cash. Only every now and then trees have to be planted actively. Thereof 75 percent are deciduous, but also Silver firs and Douglas firs are being planted. On average, over 8000 m² of forest are converted into a mixed stand every hour.

LARGE AND FORWARD-LOOKING

The Bavarian State Forest covers an area of 720,000 hectares, two-thirds of which were originally stocked with Norway spruce and other conifers. Climate change brought a change in our thinking: The forestry sector is preparing for it and is converting the pure coniferous stands into complexly structured mixed forests with a high percentage of deciduous trees.

STABLE AND MORE RELIABLE

Because forests cannot change overnight, planning has to be forward-looking. More violent storms on the one hand and more dry years on the other make it easier for the bark beetle, for instance – and in this case a pure stand is more vulnerable than a forest consisting of different tree species. In 2013 there were still 202,000 hectares of such pure stands in the State Forest. 70,000 hectares of these forests have already been regenerated in advance with climate-resilient tree species. By 2035 a further 132,000 hectares will be converted by means of planting, seeding and natural regeneration.

THIS IS HOW THE CHANGE GROWS

720,000 ha

Monocultures 202,000 ha

Planting and seeding 2,000 ha

Natural rejuvenation 5,000 ha

70,000 ha

Rejuvenated in advance

132,000 ha

Annually 7,000 ha

2013

2035

NATURAL AND COST-SAVING

On average, over 8000 m² of forest are converted into a mixed stand every hour.
Nature is a dedicated helper when it comes to forest conversion. Natural regeneration brings the forest a new generation of trees that fits and saves hard cash. Only every second plot is harvested, while the rest are left to nature. In their natural evolution they develop into the desired species. Thereof 75 percent are deciduous, but also Silver firs and Douglas firs are being planted. On average, over 8000 m² of forest are converted into a mixed stand every hour.

The Bavarian State Forest covers an area of 720,000 hectares, two-thirds of which were originally stocked with Norway spruce and other conifers. Climate change brought a change in our thinking: The forestry sector is preparing for it and is converting the pure coniferous stands into complexly structured mixed forests with a high percentage of deciduous trees.

Because forests cannot change overnight, planning has to be forward-looking. More violent storms on the one hand and more dry years on the other make life easier for the bark beetle, for instance – it’s a small but effective herbivore. It eats the bark of spruce and silver firs, and even healthy trees can become sick. To combat it, the Bavarian State Forest is preparing a large-scale changeover to mixed stands with a higher biodiversity of tree species. By 2035 a further 132,000 hectares will be converted by means of planting, seeding and natural regeneration.

The most recent generation of wind turbines have hub heights of over 100 m and can create renewable energy at the upper level of the forest. The sites have many advantages: they do not use much land, there is a lot of wind, particularly in the mid-range mountains, they are at a great distance from residential areas and they are more compatible with the landscape than in case of open-land sites.

This is how the change grows.
Let there be wood! For young seedlings there is sometimes too much going on in the forest. To control the competition for space, all the important species are nurtured in nurseries until we can let them out into the wild.

In the Laufen seedling nursery, which is 12.5 hectares large, several hundred thousand trees a year push their way into the world. Less than a third of the regeneration occurs as a result of planting or sowing – but that is the only way to change a clearing into a healthy wood after a storm.

Every hour on average, an area of the forest bigger than the size of a football field is converted into a mixed stand: 8,000 square metres.

Ganz natürlich

“Natural regeneration” of a slightly different kind.

“I like being outside every day in all weathers. I particularly enjoy working with the chainsaw.”

PATRICK WILLINGER

“What I enjoy most is solving problems on the computer and to configure and administrate servers.”

ALEXANDER NAGL

Investment in the future: Well-trained junior staff are indispensable for a modern company. That is why the Bavarian State Forest Enterprise offers training in five different occupational areas, from forestry to IT.
I like the forest in autumn best because it's so nice how the leaves rustle.

BRUNO, AN 11-YEAR-OLD PUPIL, DRAWS WHAT HE SEES AS AN IDEAL FOREST: WITH LOTS OF TOADSTOOLS, FIRS, SPRUCES – AND A HIGH PERCENTAGE OF DECIDUOUS TREES.

Whatever lasts a long time will be a good forest: Regeneration also means encouraging strong trees so that the forest of the future can grow under their canopies.
